Epic 1: Station Search and Navigation

- **Story 1.1:** As an EV driver, I want to filter charging stations by connector type (CCS, CHAdeMO), so that I only travel to compatible chargers. *(Priority: High | Story Points: 3)*
- **Story 1.2:** As an EV driver, I want to see real-time availability of charging stalls, so that I don't waste time driving to a full station. *(Priority: High | Story Points: 5)*

Epic 2: Charging Session Management

- **Story 2.1:** As a customer, I want to start and stop my charging session remotely via the app, so that I have complete control over the process. *(Priority: High | Story Points: 5)*
- **Story 2.2:** As a customer, I want to receive push notifications when my car is fully charged, so that I can move my vehicle and avoid idle fees. *(Priority: Medium | Story Points: 3)*

Epic 3: Payment and Billing

- **Story 3.1:** As a customer, I want to securely save my credit card information in the app, so that I can pay for charging sessions seamlessly. *(Priority: High | Story Points: 5)*
- **Story 3.2:** As a customer, I want to view my past charging history and download receipts, so that I can track my EV charging expenses. *(Priority: Low | Story Points: 2)*

Epic 4: User Profile and Vehicle Management

- **Story 4.1:** As a customer, I want to add my specific EV make and model to my profile, so that the app automatically filters for compatible charging stations. *(Priority: High | Story Points: 5)*
- **Story 4.2:** As a customer, I want to customize my notification preferences (SMS vs. App Push), so that I am alerted about my charging status in my preferred way. *(Priority: Medium | Story Points: 3)*

Epics, stories along with story points:

Active Sprints:

Story 1.1:

As a [user role], I want [goal], so that [benefit].

Burndown chart (for dummy project):

Reflection Question Answers:

1. Did your estimations reflect the actual effort? Yes, utilizing the Fibonacci sequence during sprint planning helped properly weigh the complexity of different features. For example, building real-time availability tracking was assigned more story points (5) than simple UI filtering (3), which accurately reflects the backend effort required. Since this was a simulated sprint, relative sizing proved to be a highly effective way to map out effort without getting bogged down in exact hours.

2. Was your backlog well-prioritized? Yes, the backlog was structured to deliver the most critical user value first. Core functionality – like filtering stations by connector type and starting/stopping charging sessions — were set to "High" priority and placed at the top. Secondary features, such as downloading past receipts, were set to "Low" priority and kept further down the backlog to ensure essential EV driver needs were addressed first.

3. How did your simulated sprint align with your plan? The simulated sprint aligned perfectly with the initial sprint plan. By pulling only the top-priority tasks (Epic 1 and Epic 2 stories) into Sprint 1, the workload remained focused. The stories progressed smoothly from "To Do" to "In Progress" and finally to "Done" without any unexpected scope creep or blocked tasks.

4. What insights did the burndown chart give about your team's capacity? The burndown chart provided a clear visual representation of our velocity. Because this was a simulated sprint and tasks were completed in rapid succession, the actual work remaining (the red line) dropped steeply below the ideal guideline (the grey line). In a real-world scenario, finishing this far below the guideline would indicate that the team either

overestimated the complexity of the tasks or has a higher capacity than initially planned, suggesting we could pull more story points into future sprints.
